

MACREX Utilities Subprogram

(Need another help file? Try [Macrex Help Contents](#) or [Macrex Main Menu Help](#). MACREX help key <CTRL><ALT>F1)

This section of MACREX has not yet been documented in html for Version 8 but there are only a few changed since Version 7, so you are referred to the [Version 7 pdf documentation](#).

The major new feature in the Utilities Subprogram is that there is a new option when you use R - Read and Correct a backup file or Import a file or E - Export a file. This can be set to

ANSI (Windows) encoding
DOS (Codepage 850) encoding

The setting only affects the handling of special and accented characters and does not affect the standard character set. If you are exporting from MACREX the setting will virtually always be ANSI. If you are importing a file from another program into MACREX, again the setting will virtually always be ANSI. However if you are loading a backup file prepared with any previous version of MACREX you will need to set this to DOS.

For further help you can try the following:

1. Look at the [Main Menu Help](#) - there are links to help on many of the major features of MACREX.
2. Look at the [Macrex Help Contents](#) - there are links to all the currently available help files.
3. If nothing is available from these, we suggest that you look at the **index** to the [Version 7 Supplement](#), which will refer you either to the relevant section in the [Version 7 Supplement](#) or to the relevant section in the [Version 6 Manual](#).

The Version 7 Supplement is a **PDF file** and the **index** is on page 54. Once the Version 7 Supplement is open you can go directly to page 54 using the Adobe PDF commands. In Adobe Reader Version 8 there is a text box near the top into which you can enter the page number.

We will be updating the help files frequently until everything is documented.
